

Indexing and Searching

To assist with rapid evidence identification, we have added a high-performance, full-featured text search engine to NetAnalysis® v2. The following data types are added to the search index:

- **Indexed Text:** Many web browsers maintain their own index to assist with searching. NetAnalysis® can extract the original data from these search databases. This data is then written out for indexing and searching.
- **Text Extracted from Web Pages:** During web page rebuilding, NetAnalysis® extracts the text from web pages by stripping HTML code, CSS and script, leaving behind the content of the page. This data is then written out for indexing and searching.
- **HTTP Entity Body:** Some browsers store HTTP entity body information. This data can contain a wide variety of valuable information which may be of interest in an investigation. This data is written out for indexing and searching.
- **Safari Reading List Preview Text:** Safari Reading List entries represent sites the user has selected to view at a later date. As part of the reading list, Safari stores a text preview of the start of the page. This data is written out for indexing and searching.
- **Chromium AutofillProfile and CreditCard Autofill Information:** Autofill forms is a feature of Google Chrome and other Chromium based browsers. It allows for the user to store information such as name, address, phone number and email address as an Autofill entry so that forms can be automatically populated. Another feature of the AutofillProfiles is the storage of credit card information. In NetAnalysis® v2, we extract this data and display it in the main grid and text display window. We also extract the corresponding user data and save it to the export folder for indexing and searching.

Once the user has created an index, it can be easily searched.

The screenshot displays the NetAnalysis Search Index application window. The title bar reads "NetAnalysis® Search Index". The main area is divided into two sections. The top section is a table with the following columns: URN, File Path, Search Hit Count, and Document Score. The table contains 13 rows of data, with the first row (URN 16722) highlighted in blue. The bottom section shows a search results preview for the query "mdma cost per kilo - Bing". The preview includes navigation options (Web, Images, Videos, Maps, News, More), search statistics (13,000,000 results), and several search results from IDMU and Yahoo Answers UK.
