HstEx v3.7

HstEx v3.7 adds a number of new features and fixes some minor bugs.

One of the major changes in this release is the fix to the speed drop issue when a large number of records are found. In v3.6, when a considerable number of records were identified during the search phase (pass one), the software would gradually slow to a crawl. This was caused by the increasing length of time it would take to check for duplicate records.

A new option has been added (user request) which allows the software to force a shutdown at the end of processing. This can be accessed from the Options menu.

The software has also been updated for the recovery of Mozilla Firefox v5+ cache entries and will now recover "wyciwyg" cache entries - see the following article:

- Firefox wyciwyg Cache Entries
